

Lecture 1.3:

Phylogenetic Methods

Popular phylogenetic methods

1. Maximum parsimony
2. Distance-based methods
3. Maximum likelihood
4. Bayesian inference

Model-based methods

Distance-Based Methods

Distance-based methods

brown bear CGTTAGTACACT

CLUSTERING
ALGORITHM

Distance-based methods

- Clustering algorithms
 - Unweighted Pair Group Method with Arithmetic Mean (UPGMA)
 - Neighbour joining
- Tree searching using optimality criteria
 - Minimum evolution
 - Least-squares inference

Strengths and weaknesses

- **Strengths**

- Very quick method
- Deals with multiple substitutions and long-branch attraction

- **Weaknesses**

- Does not use all information in alignment
- Loss of information in pairwise comparisons
- Unable to implement sophisticated evolutionary models

Maximum Likelihood

Maximum likelihood

Likelihood of hypothesis $H =$

$$P(D | H)$$

the probability of the data, given the hypothesis

Maximum likelihood

from

to

	A	C	G	T
A	-	a	b	c
C	a	-	d	e
G	b	d	-	f
T	c	e	f	-

Maximum likelihood

Likelihood = sum of all possible scenarios

Maximum likelihood

Likelihood is multiplied across sites

	L_1	L_2	L_3	...
brown bear	C	G	T	T A G T A C A C T
cave bear	C	G	A	T A G T T C A C T
black bear	C	G	T	A G T T T A C C
giant panda	C	A	T	T G G T T T A C T

Likelihood values are very small!

Maximum likelihood

brown bear **C**G**T**T**A**G**T****A**C**A**C**T**
cave bear **C**G**A**T**A**G**T**T**C**A**C**T
black bear **C**G**T**T**A**G**T**T**T****A**C**C**
giant panda **C****A**T**T**G**G**T**T****T****A**C**T**

$\ln L = -1203.83$

$\ln L = -1241.47$

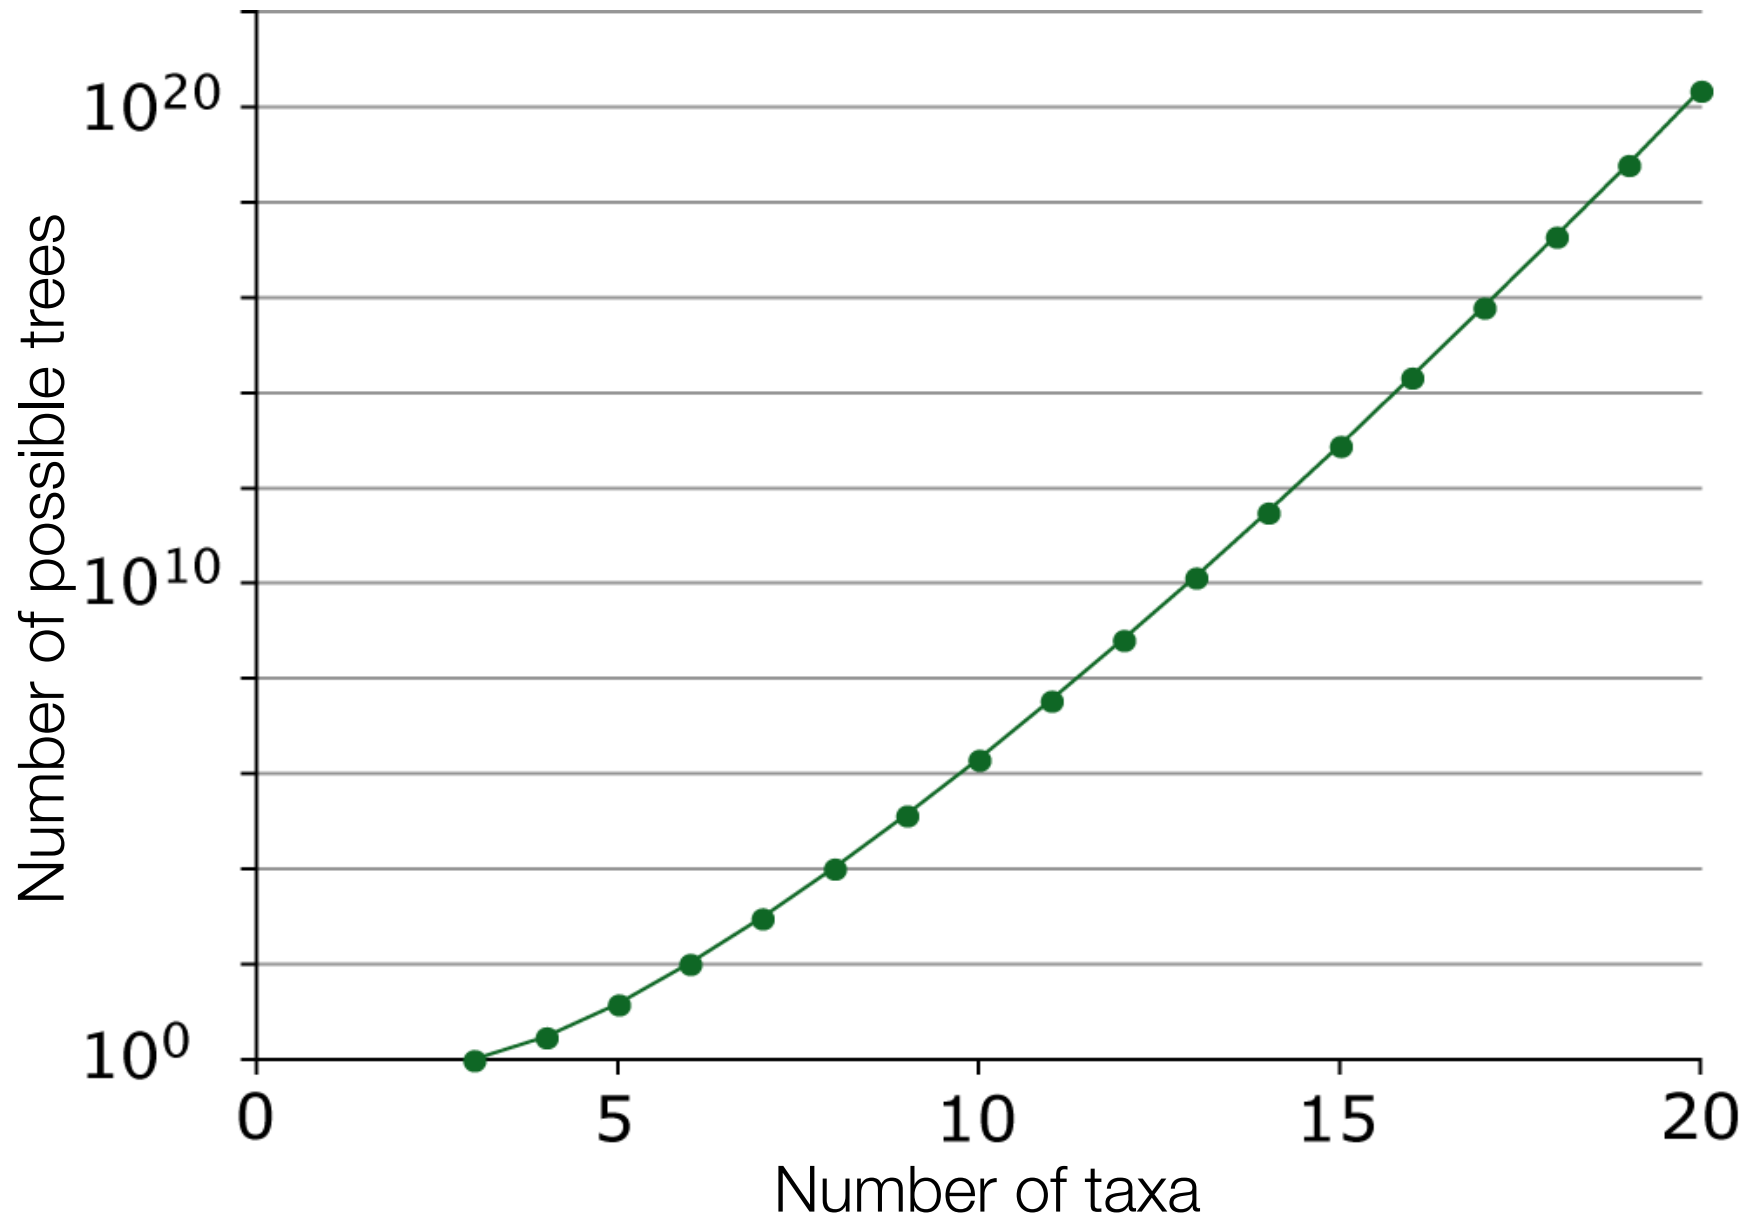

$\ln L = -908.58$

Likelihood optimisation

- Search through the space of possible trees and parameter values
- Calculate the likelihood for these
- Find best tree and model parameter values
- Multivariate optimisation

Searching tree space

Heuristic search

Heuristic search algorithms

Methods of proposing changes to trees that result in nearby trees:

- Nearest-neighbour interchange (NNI)
- Subtree prune and regraft (SPR)
- Tree bisection and reconnection (TBR)

Nearest-neighbour interchange (NNI)

Subtree prune and regraft (SPR)

Tree bisection and reconnection (TBR)

Heuristic search

1. Pick a starting tree (e.g., NJ or a random tree)
2. Use heuristic search to improve model parameters
3. Use heuristic search to improve branch lengths
4. Use NNI, SPR, and/or TBR to look for a better tree
5. Go to step 2

The result

A single set of maximum-likelihood estimates of model parameters

A single maximum-likelihood tree

Confidence intervals

- For MLEs of model parameters:
 - Can use the normal approximation (assumes symmetric variance around MLE)
 - 95% confidence interval is:
 $\text{MLE} \pm (1.96 \times \text{stdevMLE})$
- We cannot construct a confidence interval for the tree
 - Instead, uncertainty is estimated indirectly using **bootstrapping analysis**

Bootstrapping

brown bear	CGTTAGTACACT
cave bear	CGATAGTTCACCT
black bear	CGTTAGTTTACCC
giant panda	CATTGGTTTACT

Repeat 1,000 times

Pseudoreplication

brown bear	ATTACTGTCCCT
cave bear	ATTACTGTCCCA
black bear	ATCACTGTTCCT
giant panda	GTTGCTATTCCCT

Bootstrapping

This value
is only present
in rooted trees

Topology tests

- Kishino-Hasegawa (KH) test
 - Test statistic: Difference in log-likelihood between two candidate trees
 - Problem: selection bias
- Shimodaira-Hasegawa (SH) test
 - Corrects for the selection bias in the KH test
 - Very conservative test
- Approximately-unbiased (AU) test
 - Less conservative than the SH test

Strengths and weaknesses

- **Strengths**

- Rigorous statistical method
- Desirable statistical properties
- Highly robust to violations of assumptions

- **Weaknesses**

- Not feasible to implement very parameter-rich models
- Searching tree-space can be difficult
- Need to rely on heuristic search methods
- Bootstrapping analysis is very slow
